

Abstract of the Disclosure

5 An apparatus for securing an aerating device, for aerating water with fine bubbles, to an air supply conduit is provided. The aerating device is detachably connected to a mounting that is secured to an air supply conduit. The mounting is provided with an undercut groove into which engages the projection of the aerating device in the manner of a dovetail connection in order to provide the connection by means of a horizontal insertion movement of the aerating device.
